Malvern, PA 19355-0715

These instructions do not purport to cover all details or variations in equipment nor provide for every possible contingency to be met in connection with installation, operation or maintenance. Should further information be desired or should particular problems arise which are not covered sufficiently for the purchaser's purposes, the matter should be referred to the General Electric Company.

To the extent required the products described herein meet applicable ANSI, IEEE and NEMA standards; but no such assurance is given with respect to local codes and ordinances because they vary greatly.

REMOTE CHECKBACK EQUIPMENT TYPE CB10A P3

GENERAL

The automatic REMOTE CHECKBACK equipment Type CB10A P3, when used in conjunction with the MASTER CHECKBACK equipment, provides the means for automatically testing equipment such as the G. E. AUDIO TONE EQUIPMENT TYPES NN40A AND NS40A, to verify proper equipment operation.

The equipment consists of a SHELF, a POWER SUPPLY, a REMOTE CHECKBACK, and an AUXILIARY RELAY module. Detailed descriptions of these modules are included in subsequent sections of this INSTRUCTION BOOK.

This equipment was originally designed for use with CS26/27A/B BLOCKING CARRIER, therefore some of the labeling of indicators is not directly related to this application. For example, the indicator LED'S are labeled "FULL POWER" and "REDUCED POWER" whereas they are used for CHANNEL 1 and CHANNEL 2 respectively when used with NN40A or NS40A TONE EQUIPMENT.

SHELF

The SHELF serves to mount the modules, provide the necessary interconnections between the modules, and provide customer connection points.

The 3 Rack-Unit high (5.25") steel shelf is designed for flush mounting in standard EIA 19-inch racks or cabinets. Auxiliary brackets (19B218789P008, Qty. 2) are available for semi-flush mounting in shallow racks. The front door is removable. Barrier-type terminal boards, similar to GE EB-25 boards, which will accommodate wire sizes AWG 22 through AWG 10, are mounted on the printed-circuit mother-board backplane.

POWER SUPPLY

The POWER SUPPLY module occupies slot J1 in the shelf and is a DC-DC Converter. Power supplies are available for use with station batteries of 48, 110, 125, 220, and 250 Volts DC. This Converter, with battery surge and transient protection, provides +/-12VDC to operate the other modules in the shelf. A power ON-OFF switch, short-circuit protection, an alarm relay, and a fuse are part of this module. Test points on the front of the module can be used to monitor the +/-12VDC outputs.

REMOTE CHECKBACK

The REMOTE CHECKBACK module occupies slot J3 in the shelf.

Automatic testing of the system is provided by the timing and memory circuits of the MASTER CHECKBACK module. The time interval between tests is programmable from 1 to 255 hours in one-hour steps.

A test sequence can also be initiated from the REMOTE CHECKBACK, by depressing the front-panel "TEST INITIATE" pushbutton.

When applied with the TYPES NN40A or NS40A TONE EQUIPMENTS, the "FULL POWER" tests are used to verify CHANNEL ONE and the "REDUCED POWER" tests are used to verify CHANNEL TWO operation. Up to three remote terminals can be tested, and six LED'S mounted on the front panel indicate failures of either CHANNEL ONE or CHANNEL TWO for each remote.

AUXILIARY RELAY

The AUXILIARY RELAY module, located in slot J2 of the shelf, contains three mercury-wetted relays with separate inputs and outputs. The relays provide isolation between the CHECKBACK EQUIPMENT and the TONE EQUIPMENT. Front-mounted LED'S indicate which relays are energized.

APPLICATION

As the CHECKBACK EQUIPMENT actually sends a single-channel TRIP signal to verify proper channel operation, it should be applied only with DUAL channel DIRECT TRIP, or with PERMISSIVE relaying schemes.

Tone OPTIONS such as "REVERT TO SINGLE CHANNEL" or "TRIP WINDOW" cannot be used in conjunction with the CHECKBACK system.

If "TRIP HOLD" is used in the optional tone LOGIC MODULE, the tone "TRIP RECEIVED" signal used as the CHECKBACK "RECEIVE" input must be taken directly from the tone RECEIVER, rather than from the output of the LOGIC circuit.

The TONE EQUIPMENT must be equipped with the AUXILIARY RELAY module. Two of the relays on this module are employed to supply the "TRIP RECEIVED" signals to the CHECKBACK. This is necessary because the TONE EQUIPMENT heavy-duty output relays are not fast enough to follow the CHECKBACK signals.

OPERATION

The MASTER CHECKBACK test cycle can be initiated by the BUILT-IN CLOCK, by the front-panel "TEST INITIATE" push-button, by the operation of the supervisory "TEST INITIATE" relay, or by receipt of a "REQUEST FOR TEST" signal from a REMOTE CHECKBACK module.

The test cycle is composed of nine segments of one second each, as follows:

1. During the first segment, the MASTER CHECKBACK sends eight pulses of 32 msec. width at 16 cps on channel one. This initiates the REMOTE CHECKBACK test sequence.
2. The REMOTE CHECKBACK is programmed to respond with eight pulses on channel one in the second, third, or fourth time segment. These are designated as "FULL POWER 1, 2, or 3".
3. During the fifth segment, the MASTER CHECKBACK sends four pulses of 32 msec. width at 16 cps on channel two.
4. The REMOTE CHECKBACK is programmed to respond with four pulses on channel two in the sixth, seventh, or eighth time segment. These are designated as "REDUCED POWER 1, 2, or 3".
5. The ninth and final segment is used by the MASTER CHECKBACK to initiate alarms, initiate the automatic re-test function, or (in the event of a successful test) reset all circuits.

SHELF ASSEMBLY Remote Checkback

Assembly Drawing No:

19C335803G5 48 VDC
19C335803G6 110/125 VDC
19C335803G7 220/250 VDC

Consists of:

Backplane Asm.-19D436577G5 48 VDC
-G6 110/125 VDC
-G7 220/250 VDC

Case Asm.-19C335651G3

Door Asm.-19B230622G2

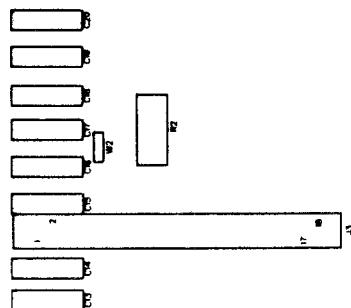

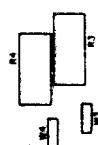

The Remote Checkback Shelf consists of a keyed, slotted chassis that holds three plug-in card-type modules, each equipped with 18 contacts that mate with contacts mounted on the backplane on the rear of the chassis.

All groups of the backplane contain two 10-point barrier-type terminal boards, similar to GE EB-25 boards, which will accomodate wire sizes AWG 22 through AWG 10, and the SWC capacitors (C1, C2).

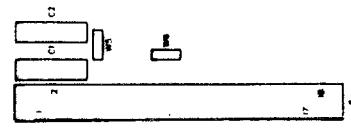

The 48 VDC version (-G5) contains component W1, which is a zero-ohm resistor. In the 110/125 VDC version (-G6) and the 220/250 VDC version (-G7), W1 is replaced by resistor R1.

SCHEMATIC DIAGRAM-19B230657 Sh. 2

**TYPE NS40A
POWER SUPPLY
PL-19D427468G 2, 4, 6,
10-12**

DESCRIPTION

The Power Supply module provides the conversion from the DC battery voltage to the regulated +12 VDC. Different Group Numbers are used for different battery voltages:

<u>Group</u>	<u>Battery Voltage</u>
2	24 VDC
4	48
6	125
10	250
11	110
12	220 VDC

OPERATION

Refer to Schematic Diagram 19D427526 which is included in this instruction.

The input voltage is applied to the converter through a 2-pole switch S1. This switch also provides a switched battery output. The positive input is fused (F1) and the negative input includes a reverse voltage protection diode (D54). An input filter (T2, C9, C11 and C12) attenuates noise from the power source to the power supply and vice-versa.

The DC-DC converter (A1) is a fixed frequency (20 kHz) variable pulse width regulator. Integrated circuit AR3 generates a 20 kHz square-wave with a duty cycle of 90%. Flip-flop U2 alternates the power pulse between power transistors Q6 and Q11. Transistors Q2 through Q5 and Q7 through Q10 interface the CMOS gates U1-C and U1-D with the power transistors.

Secondary winding 9 and 10 of T1 provides the supply voltage for the control circuits plus the voltage control loop. These secondary voltage pulses are rectified by diodes D4 and D5, and integrated by resistor R47 and capacitor C3. Integrated circuit AR2 senses when this voltage has reached a predetermined level and switches the output pulse OFF.

Integrated circuit AR1 provides short circuit protection by sensing the emitter current of Q6 and Q11 through resistor R24, and switching the output pulse OFF when the emitter current exceeds a predetermined level. This circuit also limits the in-rush current when the power supply is first turned ON.

Transistor Q12 prevents gate U1-A from switching ON until the supply voltage for the control circuits reaches its normal level through resistor R31.

Secondary winding 4 and 5 of T1 provides the negative bias voltage to switch power transistors Q6 and Q11 OFF.

Variable resistor R8, ±12 VDC OUTPUT LEVEL ADJ, is used for adjusting the output to ±12 VDC.

The ±12 VDC output is rectified by diodes D9 through D12 and filtered by inductors L1 and L2 and capacitors C14, C18 and C19.

The alarm circuit switches ON when the output voltage (3/C - 15/S) reaches 23 VDC and OFF if the output voltage drops to 17 VDC. Form C alarm contacts are provided.

NOMINAL OPERATING CHARACTERISTICS

1. Input Voltage:

- a. Group 2 21 VDC to 28 VDC at 600 mA max.
- b. Group 4 42 VDC to 56 VDC at 300 mA max.
- c. Group 6 103 VDC to 142 VDC at 125 mA max.
- d. Group 10 210 VDC to 280 VDC at 10 mA max.
- e. Group 11 96 VDC to 124 VDC at 125 mA max.
- f. Group 12 192 VDC to 248 VDC at 80 mA max.

2. Output voltage:

- a. $+12 \pm 1$ VDC, 500 mA max.
- b. -12 ± 1 VDC, 500 mA max.

3. Low Voltage Alarm: form C contacts, 100 VA

- a. Pick-up 23 VDC max.
- b. Drop-out 17 VDC min.

TYPE CS28A CHECKBACK (REMOTE)**PL-19D428721G2**

Schematic 19D435387

DESCRIPTION

The Remote Checkback Module responds to the signal sent by the Master Checkback by sending a signal to the Master Unit during its preassigned time slot. All the timing signals are controlled by a crystal oscillator. When the signal from the Master Checkback is detected, the clock is started.

Normally, each remote uses two time slots, (one for a full power test and the other for a reduced power test) and three remotes may be tested by the Master Checkback. In special applications of more than three remotes some remotes may be assigned only one time slot (see SPECIAL APPLICATIONS). Each segment or time slot of the test is a one second interval.

A manual test switch on the remote unit will generate a signal to the master unit that is recognized as a command to switch to the test mode. This allows a checkback test to be manually initiated at any of the remote sites.

Full and reduced power alarm lights allow the checkback test to be observed at any remote site. A checkback disable input stops any test in progress and resets all circuits.

OPERATION

Refer to the Schematic Diagram and Pictorial Diagram which are included in this section of this manual.

The 32,768 Hz frequency at the output of crystal oscillator AR1 is divided down to 16 Hz at Pin 1 of U1 and down to 1 Hz at Pin 6 of U2. Counters U1 and U2 are inhibited from counting by NOR gate U3-D until a test signal is detected from the Master Checkback.

Input pulses from the Receiver will switch AR2. The output of AR2 is connected to

Bandpass Filter AR3-A and Transistor Switch Q7. As the pulses are received, Q7 causes the alarm lights to flash at a 16 Hz rate.

The 16 Hz pulses are detected by AR3-B and applied to clock input of counter U11 through inverter AR3-C. Timing circuit AR3-D is switched LOW by the first pulse and allows U11 to count the pulses. If a pulse is delayed or missing AR3-D will switch positive and reset counter U11. This prevents random pulses from counting up to the desired number. When counter U11 reaches 8, Pin 9 switches to a 1, setting Flip-Flop U12-B.

This starts counter U14 and when it reaches its predetermined count, Pin 1 momentarily switches to a 1 and this sets Flip-Flop U4-A. Flip-Flop U4-A switches a 1 to Pin 5 of NAND gate U6-B and Pin 12 of NOR gate U3-D. It also applies a 1 to Flip-Flop U5-A and this Flip-Flop is set on the next clock pulse. U3-D switches to a 0 and clock U1 and U2 is started. The 1 Hz clock signal is applied to counter U8 through inverter U3-A and NOR gate U3-B. Jumper B selects the time slot that the remote reports back in at full power and Jumper C selects the time slot that the remote reports back in at reduced power. Pin 2 of counter U8 switches to a 1 during the first period of the 1 Hz clock. When Jumper B is in the 1-2 position, NAND gate U6-B is switched 0 and this gates the 16 Hz pulses through NOR gate U3-C to the STOP output. The output pulses are counted by U7 and when they reach 8, Pin 11 of U7 switches to a 1, resetting Flip-Flop U4-A. Since Flip-Flop U5-A is set, U3-D remains at 0 and the clock continues to run.

At the start of the first time period, Pin 2 of U8, will also set Flip-Flop U16-A, unless jumper D is in the 1-2 position. With jumper D in the 2-3 position, the incoming pulses will flash full power alarm light #1 and will be switched OFF by the 8 pulse detector output U14, Pin 1 through NAND gate U15-A and inverter U15-B.

During the second 1 Hz clock period, remote #2 will report back and the full

power alarm light #2 will be flashed by the 8 incoming pulses and will be switched OFF by the 8 pulse detector through NAND gate U15-C and inverter U15-D.

The above sequence is repeated by remote #3, except with full power alarm light #3, during the third 1 Hz clock period.

At the start of the fourth 1 Hz clock period, the Master Checkback sends 4 pulses at 16 Hz and Pin 10 of counter U8 releases the inhibit on Flip-Flop U4-B. The four pulses are detected by U3-B and when counter U11 reaches 4, Pin 10 switches to a 1 setting Flip-Flop U12-A. Flip-Flop U12-A releases counter U13 and when it reaches its predetermined count, Pin 1 switches to a 1, setting Flip-Flop U4-B. Flip-Flop U4-B switches to a 1 at Pin of NAND gate U6-A.

When jumper C is connected to position 1-2, at the start of the fifth 1 Hz clock period, Pin 1 U8 switches U6-A to 0 and this gates the 16 Hz pulses to the STOP output through NOR gate U3. When counter U7 reaches 4, Pin 1 of U7 switches to a 1 and resets U4-B. At the start of the period U6-A also switches REDUCED POWER, ON, through inverter U6-C. Reduced power is switched off when U4-B resets.

When jumper G is in the 1-2 position, the 4 incoming pulses will flash Reduced Power Alarm Light #1 and then it will be switched OFF by the 4 pulse detector output U13, Pin 1 through NAND gate U19-A.

During the sixth 1 Hz clock period, remote #2 will report back and the reduced power alarm light will be flashed by the 4 incoming pulses and will be switched OFF by the 4 pulse detector through NAND gate, U19-C and inverter U19-D.

The above sequence is repeated by remote #3, except with the reduced power alarm light #3, during the seventh 1 Hz clock period.

At the start of the eighth 1 Hz clock period, Pin 9 of U8 switches to a 1, which resets all circuits, except the alarm light circuits, ending the test.

NOMINAL OPERATING CHARACTERISTICS

1. Power Requirements:

+ 12 VDC, 65 mA
- 12 VDC, 65 mA
2. Oscillator Frequency (TP1); 32,768 Hz
3. Outputs: Stop, Start and Reduced Power
 - a) OFF: -6 VDC
 - b) ON: +6 VDC
4. Inputs:
 - a) Checkback Disable:
 1. OFF: -6 VDC
 2. ON: +6 VDC
 - b) Input:
 1. OFF: >3.5 VDC
 2. ON: <0.5 VDC
5. Pulse Frequency (TP-2-During Test): 16 Hz
6. Time Slots: 1 sec.

SPECIAL APPLICATIONS

As previously stated each remote (up to three) is normally strapped to respond in both a full power time slot (8 pulses in time slots 2,3 or 4) and in a reduced power time slot (4 pulses in time slots 6, 7 or 8). When it is desired to test more than three remote stations, two or more stations may be programmed to respond in only the full power time slot or in the reduced power time slot. With six time slots available (2, 3, 4, 6, 7 and 8) up to six remotes may be used. Units assigned to time slots 2, 3 and 4 will respond with eight pulses at full power and units assigned time slots 6, 7 and 8 will respond with four pulses at either full or reduced power level. This

special response is accomplished by adding or deleting jumpers W1, W2 and W3. A standard unit (which responds in both a full power and a reduced power time slot) has W1 and W3 installed (W1 and W3 are "zero-ohm" resistors). Modification for response in only one time slot are as follows:

1. Respond only in full power time slot.

Remove W2. Select time slot with jumpers B and C (Jumper C will not produce an output but must be installed for proper operation).

2. Respond only in reduced power time slot at reduced power level.

Remove W1. Select time slot with jumper B and C. (Jumper B will not produce an output but must be installed for proper operation).

3. Respond in only reduced power time slot but at full power level.

Remove W1 and W2. Install W3 (use W1, W2 or solid wire for W3). Select time slot with jumpers B and C (Jumper B will not produce an output but must be installed for proper operation).

The Master Checkback will indicate an alarm for failure of time slots 2, 3 or 4 as "Full Power 1, 2 or 3" respectively and failure of time slots 6, 7 or 8 as "Reduced Power 1, 2 or 3" respectively.

TABLE I

TYPICAL CHECKBACK (REMOTE)
TEST POINT READINGS

<u>Receiving Normal Input Signal Level from Master, Normal Strapping</u>	
Test Point	Reading
TP-1	Square Wave @ 32.768 Hz
TP-2	Square Wave @ 16 Hz
TP-3	Square Waves @ 1 Hz Amplitude approx. 15 Volts peak-to-peak

<u>FULL POWER TEST</u>	
Pin 4 (Input)	8 Negative Pulses @ 16 Hz rate approx. 15 Volts peak-to-peak
Pin 5 (Stop)	8 Positive Pulses @ 16 Hz rate approx. 15 Volts peak-to-peak
Pin 6 (Red Pwr)	No Signal
Pin 7 (Start)	8 Negative Pulses @ 16 Hz rate approx. 15 Volts peak-to-peak

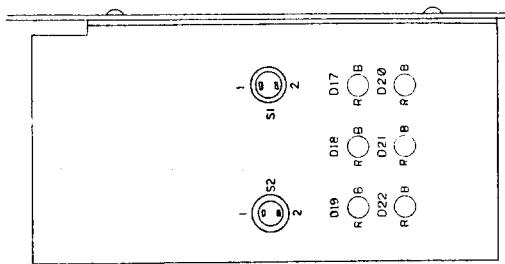

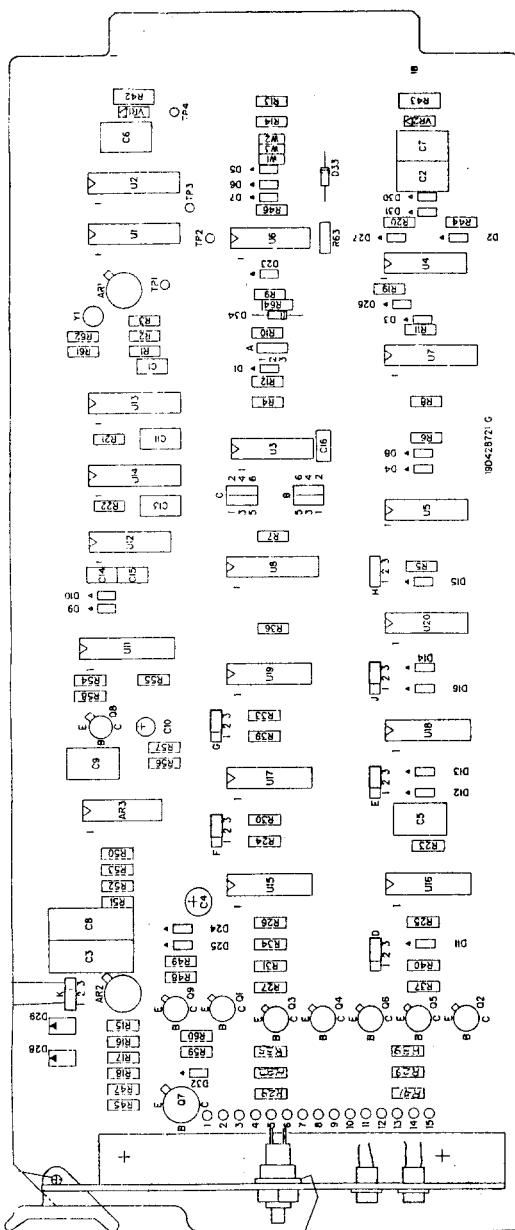

<u>REDUCED POWER TEST</u>	
Pin 4 (Input)	4 Negative Pulses @ 16 Hz rate Approx. 15 Volts peak-to-peak
Pin 5 (Stop)	4 Negative Pulses @ 16 Hz rate Approx. 15 Volts peak-to-peak
Pin 6 (Red Pwr)	4 Negative Pulses @ 16 Hz rate Approx. 15 Volts peak-to-peak
Pin 7 (Start)	No Signal

Remote Checkback Schematic

AUXILIARY RELAY 19D427620G3

DESCRIPTION

The Auxiliary Relay, 19D427620G3, is used in conjunction with the CB10A Checkback Equipment. It provides isolation between the Checkback shelf and the associated PLC equipment through use of three mercury-wetted relays. These relays have separate inputs and outputs. Three LED indicators show which relay is energized.

OPERATION

Refer to the Schematic Diagram located in this instruction. A positive input signal applied to the INPUT of relay #1 or to INPUT #1 of relay #2 will switch the associated input amplifier ON. This switches on the relay driver Q1 or Q2, energizing K1 or K2. A positive input to INPUT #2 of relay #2 will override an INPUT #1 of relay #2 and lock the relay #2 input amplifier in the OFF position.

Relay K3 is energized directly by application of 125 VDC (Jumper "A" in the 1-2 position) or 48 VDC (Jumper "A" in the 2-3 position) to relay #3 INPUT #1 (+) and INPUT #2 (-). An external resistor is used for 250 VDC applications.

NOMINAL OPERATING CHARACTERISTICS

1. Input level

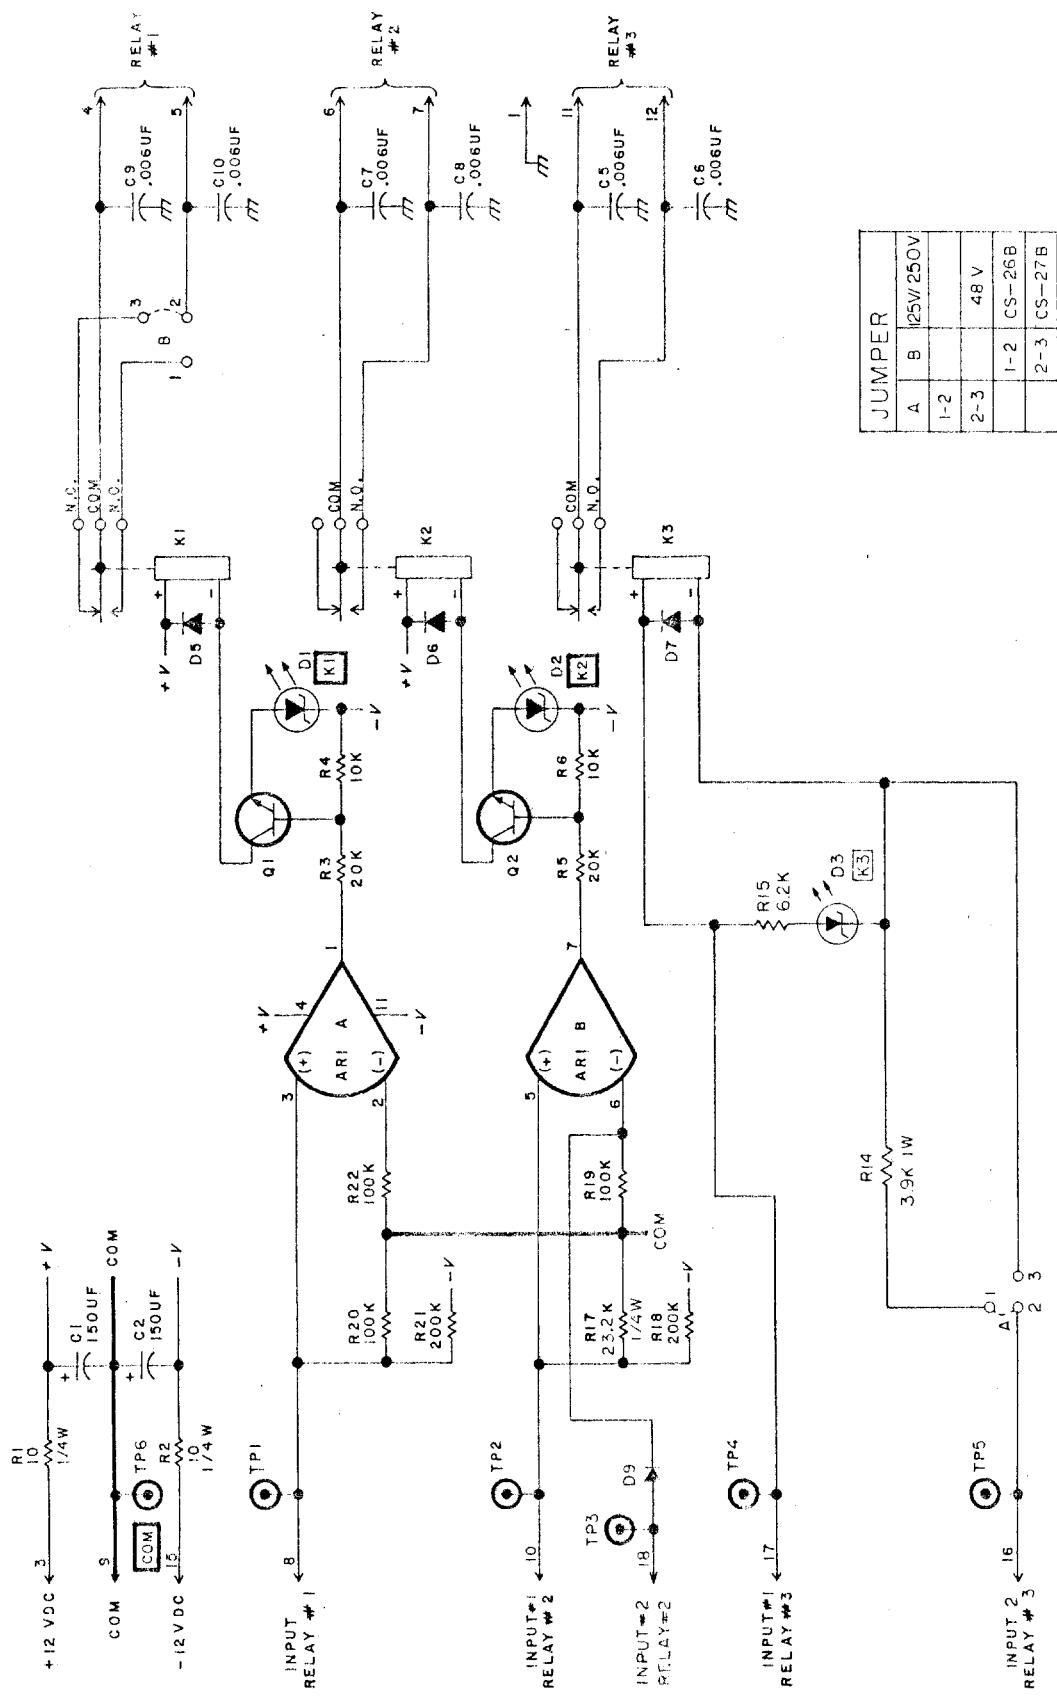

a.	Relay #1 INPUT,	Relay #2 INPUT #1, +10 VDC=ON
b.		Relay #2 INPUT #2, +10 VDC=OFF
c.	Relay #3	Jumper "A" 1-2 125 VDC
		Jumper "A" 2-3 48 VDC

2. Output contacts: 100 VA

3. Relay operate time: 2 milliseconds max.

AUXILIARY RELAY-PARTS LIST - 19D427620G3

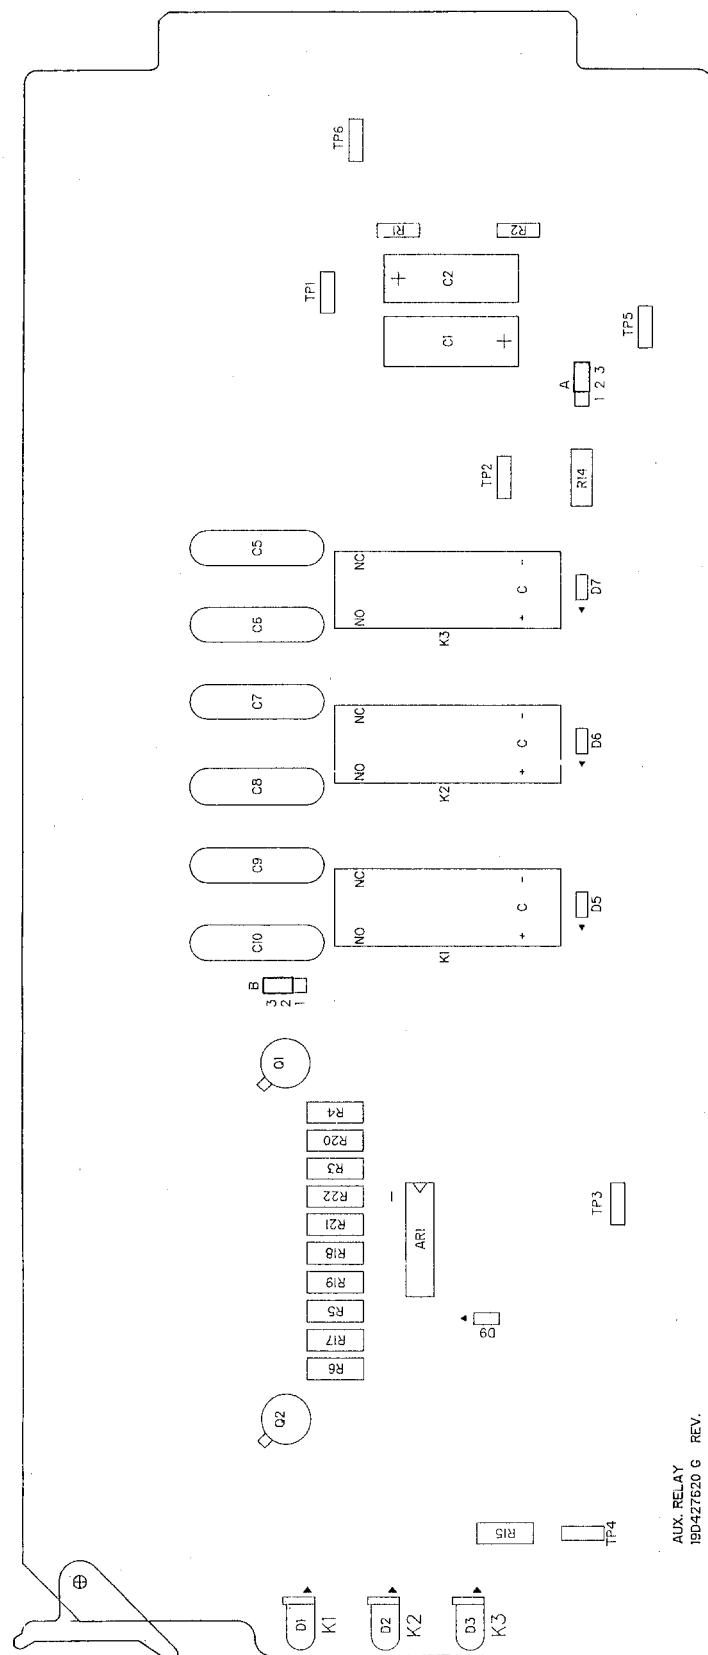

SCHEMATIC DIAGRAM-19C335562 [2]

NOTES:

ALL RESISTORS ARE 1/2 WATT UNLESS OTHERWISE SPECIFIED AND RESISTOR VALUES IN OHMS UNLESS FOLLOWED BY K (1000 OHMS OR MEG = 1,000,000 OHMS). CAPACITOR VALUES IN PICOFARADS EQUAL TO MICROMICROFARADS (UNLESS FOLLOWED BY UF). INDUCTANCE VALUES IN MICROHENRIES UNLESS FOLLOWED BY MH. MILLIHENRIES OR H•HENRIES.
