

INSTRUCTIONS

PRELIMINARY GEK-24962

DIVIDER, 193X542A_G01-G04

These instructions do not purport to cover all details or variations in equipment nor to provide for every possible contingency to be met in connection with installation, operation or maintenance. Should further information be desired or should particular problems arise which are not covered sufficiently for the purchaser's purposes, the matter should be referred to General Electric Company.

GENERAL ELECTRIC

**PRELIMINARY
INSTRUCTIONS
DIVIDER, 193X542A G01-G04**

1.0 GENERAL

This instruction provides basic information regarding the subject card. Refer to the system elementary diagrams for information relating to the overall system operation.

2.0 DESCRIPTION

The card contains either one or two integrated circuit divider chips with the following group arrangements:

G01 and G03 one channel
G02 and G04 two channels

The G01 and G03 card, and the G02 and G04 card are both mechanically and functionally interchangeable. Different groups for the equivalent functions identify use of different electronic devices. A transistor power supply is furnished to convert from $\pm 20V$ to $\pm 15V$.

PERFORMANCE

The card will have the following characteristics while exposed to the conditions indicated:

2.11 Division

With $+20V$ and COM applied to tabs 31, 2 and 15 respectively, the card will generate a nominal output voltage of

$$OP = 10 \cdot N/D$$

where the input signal voltages N and D are within the ranges of

$$\begin{aligned} .1V \leq D \leq 10V \text{ and} \\ |N| \leq D \end{aligned}$$

2.12 Overall Accuracy

Total error (25°C): $\pm .65\%$ max. or $\pm 0.65\text{V}$ for $D > .1V$

Total error vs temp: $\pm .033\%/\text{ }^{\circ}\text{C}$ or $3.3\text{mV}/\text{ }^{\circ}\text{C}$

Total error vs. power supply: $\pm .15\%/\%$
($\pm 0.15\%$ at 25°C and $0.033\%/\text{ }^{\circ}\text{C}$ of
error is caused by power supply variation)

Warm-up time to rated performance: 5 min.

2.13 Output

Max. output voltage: $\pm 10V$
Max. output current: $\pm 5\text{mA}$
Output Impedance: $.1 \text{ ohm}$

2.14 Input

Rated numerator voltage, N: $\pm 10V$ with
 $|N| \leq D$
Rated denominator voltage, D: $\pm 10V$ with
 $N > 0$
Max. safe input voltage, N, D: $\pm 15V$
Input Impedance: $N=9\text{K ohm}, D=25\text{K ohm}$

2.15 Power Supply

Range: $15V \pm .15V$ at tab 26, $-15V \pm .15V$
at tab 8
Quiescent current: $+15\text{mA}, -9\text{mA}$ at $\pm 15V$,
 $+31\text{mA}, -25\text{mA}$ at $\pm 20V$.

2.16 Temperature

Rated performance: 0°C to $+70^{\circ}\text{C}$
Max. operating: -25°C to $+85^{\circ}\text{C}$

3.0 ADJUSTMENTS

There are no adjustments on this card.

4.0 TROUBLESHOOTING

4.1 Check for $+15 \pm 1$ volts at tab 26, -15 ± 1 volts at tab 8

4.2 With $+20$ volts, -20 volts and Com applied to tabs 31, 2 and 15 respectively, apply 10 volts to N1 and D1 or N2 and D2. Card output for this condition should be 10 volts $\pm 0.65\%$.

If the output does not fall within this value, the card should be replaced.

4.3 Use an oscilloscope to determine if excessive noise on any of the input signals causes a distortion of the output signal during system operation. Filtering of the input signal(s) may be necessary to improve operation.
